

# PIIPS

Precision Intelligent Invoice Processing Suite · v2.2

**Role: Viewer**

A screen-by-screen guide to the invoice processing application,  
covering exactly the screens available to your role.

## About the Viewer role

Viewer is a fully read-only role. It sees the same live invoice data as every other role, but cannot create, update, save, or change anything, anywhere in the application.

You have access to seven screens: **Dashboard**, **File Explorer**, **Buyer Order Entry**, **Part Description Mapping**, **Load**, **Post**, and **Complete**. Each shows the real, current data every other role works from — nothing is hidden or filtered down for you.

### You can open

- Dashboard
- File Explorer
- Buyer Order Entry
- Part Description Mapping
- Load
- Post
- Complete

### You will not see

- Manual
- Folder / Database / API Configuration
- Template, Create Field, Field Mapping
- Model Training
- User Management
- Mail Server Setting
- Announcement, Publish

Those extra screens configure the application itself — folders, database, templates, field mappings, other users — rather than show invoice data, so they aren't part of a read-only role. You also don't see the **Manual** screen that other roles use to download their own guide; this PDF is handed to you separately instead.

**How your account is set up.** Unlike every other role, a Viewer account is not self-service. A Super Admin creates it directly and chooses your username *and* password themselves — you are never emailed a temporary password, you are never forced to change it on first sign-in, and the usual password-complexity rule doesn't apply to it either. The password your Super Admin gives you is meant to be your permanent one. Turning your access on or off, likewise, never sends you an email, since a Viewer account isn't normally given an email address at all.

**Forgot your password?** The **Forgot password?** link on the login screen only works if your account has an email address on file. Most Viewer accounts don't have one, by design — so for you it will quietly do nothing (it never reveals whether an account exists, so you won't see an error either). If you can't sign in, ask your Super Admin to set a new password for you directly, the same way your original one was set. If a Super Admin later adds an email address to your account, both Forgot password and an Admin-triggered password reset will then work for you exactly as they do for every other role, emailing the new password to that address.

## Logging in

Open PIIPS in a browser and sign in with the username and password your Super Admin gave you directly.

Type your username and password, then select **Login**. There is no first-time “set your own password” screen for a Viewer account the way there is for every other role — the password your Super Admin chose for you is already the one you use from now on.

**Already open elsewhere?** PIIPS only keeps one copy of itself running at a time. Opening it in a second tab or window shows a blocking “PIIPS is already open” screen instead of the app — close or switch to the other tab, then select **Try Again** there.

# Dashboard

Your home screen after signing in — the same live counts everyone else sees.

The right-hand panels show a live count of every invoice PDF the system knows about — **Invoices by status**, a status pie chart, and a per-status **Status breakdown** list you can click to jump straight to that status's invoices. The **Batches** table lists every processing run. The bell icon opens any active site-wide announcement a Super Admin has published.

**The Start button doesn't disappear for you.** PIIPS doesn't hide or grey out the **Start** button for a Viewer — it looks exactly as clickable as it does for everyone else. Press it anyway and the server refuses the request outright, showing **Viewers have read-only access.** in place of the run results, and nothing is processed:

# File Explorer

Everything PIIPS currently knows about, by folder.

Pick a template from the dropdown to browse the PDFs sitting in its working folder — newly-dropped invoices waiting to be processed, anything the system couldn't confidently match to a known vendor format, and anything it recognised but couldn't fully read. Open a file directly from the list to preview it, exactly as any other role can.

**Upload PDFs is visible but blocked.** The **Upload PDFs** button is shown and enabled the same as for every other role — but choosing files and attempting the upload is rejected by the server with the same **Viewers have read-only access.** response as the Dashboard's Start button. Nothing is copied into the folder.

# Buyer Order Entry

See which invoices have a purchase order number PIIPS couldn't confidently match against SPRPUR.

Buyer Order Entry

Invoices whose Buyer Order No. could not be read (missing or doubtful). Enter the correct PO and Save — the invoice is re-validated and, if no other error remains, becomes active and moves forward.

PIIPS tries to detect the buyer's PO number on every invoice automatically, splitting matches into confident and doubtful. This screen lists the invoices whose Buyer Order No. is missing or doubtful — you can see exactly what PIIPS extracted and open the invoice file itself to check it.

**Save is visible but blocked.** The Buyer Order No. field and the **Save** button next to each row are shown just as they are to a User or Admin — but typing a correction and selecting Save is rejected server-side with the same read-only error. Only a User, Admin, or Super Admin can actually correct and save a PO number here.

## Part Description Mapping

Compare Service First's own part records against the invoice's own description to spot why a part didn't match.

**Part Description Mapping**

Service First's own purchase-line records for every Buyer's Order No currently at DATA MISMATCH - compare against the invoice's own description to spot why a part didn't match.

For every Buyer's Order No. currently at DATA MISMATCH, this screen lines up Service First's own purchase-line details (part number, quantity, unit price, SF's part specification) next to the description as it appears on the invoice itself — letting you see, invoice by invoice, why a part failed to match.

**Update is visible but blocked.** The description text box and its **Update** button are fully interactive for you, but submitting a change is rejected server-side the same way as everywhere else. Only a User, Admin, or Super Admin can actually push a corrected description back to Service First.

# Load

See which processed, PO-confirmed invoices are ready to become purchase records.

Load lists invoices that already have a Navision Document No. and are ready to be turned into a real Purchase record, moving their status to **LOADED**. You can select rows, filter by batch, and open any invoice's PDF — the same list every User, Admin, or Super Admin sees.

**Mark as Loaded is visible but blocked.** The selection checkboxes and the **Mark as Loaded** button work in the interface exactly as they do for a User — but selecting invoices and pressing it is rejected server-side with the same read-only error, and no invoice actually advances to LOADED.

# Post

See which Loaded invoices are ready to be sent on to the downstream Service First system.

Posting calls the Service First API to record the purchase there and moves an invoice's status to **POSTED**. You can see the full list and open any invoice, exactly as any other role can.

**Post is the one screen that tells you up front.** Posting and rejecting have always been limited to Accounts, Admin, and Super Admin — a rule that happens to already exclude Viewer too. So unlike every other screen in this guide, PIIPS doesn't show you a live-looking button here at all: the action area simply reads “Accounts, Admin, or Super Admin access required to post.” The per-row **Reject** button used by those roles is likewise never shown to you. It's the only screen where the interface itself, rather than a rejected request, makes clear you can't act.

# Complete

See which Posted invoices have been fully reconciled and closed out.

Complete is the final lifecycle step, marking an invoice finished once everything downstream has been confirmed. You can see the full list, filter by batch, and open any invoice, exactly as any other role can.

**Mark as Completed is visible but blocked.** As with Load, the selection checkboxes and the **Mark as Completed** button are fully interactive for you — but the action itself is rejected server-side, and no invoice is actually closed out.
