

PIIPS

Precision Intelligent Invoice Processing Suite · v2.2

Role: Admin

A screen-by-screen guide to the invoice processing application,
covering exactly the screens available to your role.

Logging in

Open PIIPS in a browser and sign in with your username and password.

Type your username and password, then select **Login**. The password field has a show/hide (👁) button so you can check what you typed, and pasting into it is deliberately blocked — type it by hand so a copied value from the wrong place can't end up there unnoticed.

Forgotten your password? Select **Forgot password?** on the login screen (below). Nobody sets your password for you, including administrators — every password on PIIPS is system-generated and emailed to your official email address, and you're always required to choose your own on first use.

Already open elsewhere? PIIPS only keeps one copy of itself running at a time. Opening it in a second tab or window now shows a blocking **"PIIPS is already open"** screen there instead of the app — close or switch to the other tab, then select **Try Again** here.

Enter your username or email and submit. If an account matches, a new temporary password is emailed to it; the response is the same either way so the screen can't be used to check whether a username exists.

What each role can see

Once signed in, only the screens your role has access to appear in the left-hand sidebar — you will never see menu items outside your role's access, and the server enforces the same limits even if a screen were reached directly.

Setting your password the first time

The temporary password from your welcome email (or from a password reset) only gets you as far as this screen — you must choose your own password before doing anything else in PIIPS.

Enter the temporary password, then a new password meeting the policy shown on screen: **at least 5 characters, with an uppercase letter, a lowercase letter, a number, and a special character**. Select **Set password and continue** to enter the application.

This same screen appears any time an administrator resets your password for you — a new temporary password is always emailed, and you always set your own replacement for it on your next sign-in.

What the emails look like

PIIPS emails you at three points: when your account is created, whenever your password is reset (by you via Forgot password, or by an administrator), and if your account's access is turned on or off.

Welcome email

Password reset email

Dashboard

Your home screen after signing in.

The right-hand panels show a live count of every invoice PDF the system knows about — a total badge next to **Invoices by status** and **Status breakdown**, a status pie chart, and a per-status count list you can click to jump straight to that status's invoices. The bell icon (🔔) in the top bar opens any active site-wide announcement a Super Admin has published — a red dot means there's one you haven't opened yet.

Opening an announcement from the bell icon

File Explorer

Everything PIIPS currently knows about, by folder.

File Explorer lists the PDFs sitting in the working folders: newly-dropped invoices waiting to be processed, anything the system couldn't confidently match to a known vendor format (**Unsupported**), and anything it recognised but couldn't fully read (**Incomplete Data**) — including scanned or photocopied PDFs, which are routed here rather than guessed at. Open a file directly from the list to preview it.

Manual

This document, from inside the application.

Every signed-in user can download their own manual at any time — always the edition matching your role, and stamped with your username and the date/time you downloaded it. Super Admins additionally see the full Developer Manual and the UAT/Live Deployment Guide here.

Buyer Order Entry

Confirm or correct a purchase order number PIIPS matched (or couldn't match) against SPRPUR before an invoice can be Loaded.

PIIPS tries to detect the buyer's PO number on every invoice automatically, splitting matches into **confident** and **doubtful**. Use this screen to review doubtful matches, or to enter a PO number by hand when none was detected. Nothing reaches the Load step without a confirmed PO number.

Load

Bring a processed, PO-confirmed invoice into the system as a purchase record.

Loading is the first lifecycle step after extraction: it turns the extracted header/line/reservation data into a real Purchase record and moves the invoice's status to **LOADED**, ready for Accounts to Post.

Post

Send a Loaded invoice on to the downstream Service First system.

Posting calls the Service First API to record the purchase there and moves the status to **POSTED** once it succeeds, tracking whether the part was received (`IsSynced`).

Complete

Close out a Posted invoice once it's fully reconciled.

Complete is the final lifecycle step, marking an invoice finished once everything downstream has been confirmed.

Folder Configuration

Set the single working Folder Path PIIPS uses for Input, New_Format and its extracted output.

Folder Configuration

Standard

Folder

Folder Path

The working folder. Must be a folder on the **server machine** — not a network share or a mapped network drive. On save, the **Input** folder (with a subfolder for each template) and **New_Format** are created here, and extracted output is written here.

D:\PIIPS

Save

Every other folder (per-template Input subfolders, Unsupported, Incomplete Data, the ALL_INVOICES archive of every Posted/Completed invoice) lives underneath this one path.

API Configuration

Set the base URL of the Service First / NAV backend used for reservation and HSN lookups and for Posting.

User Management

Create accounts, control access, and manage passwords for other users.

The screenshot displays the PIIPS User Management interface. On the left is a dark sidebar with a menu including Dashboard, File Explorer, Manual, Buyer Order Entry, Load, Post, Complete, Folder Configuration, API Configuration, Template, Create Field, and User Management (highlighted). The main content area is titled 'User Management' and contains two forms. The 'Change Password' form has a dropdown for 'User', input fields for 'New password' and 'Confirm new password', and a 'Change password' button. The 'Add user' form has input fields for 'User Name' and 'Email', and a 'User Type' dropdown set to 'User'. A 'Standard' dropdown is visible in the top right corner.

Adding a user

Give the new account a username and their official email address, and choose their role. There is no password field — PIIPS generates a policy-compliant temporary password and emails it to them automatically; the person creating the account never sees or sets it.

Activating / deactivating a user

Every row has an **Inactivate** / **Give access** button; either action emails the affected user a notice. You can't deactivate your own account, and the default **Sadmin** super admin account can never be deactivated by anyone — it's the one account guaranteed to always be available.

Change Password

Who can reset whose password is deliberately restricted:

- **Super Admin** — can assign a new password to *any* user, including themselves.
- **Admin** — can assign a new password only for a plain **User** or **Accounts** account — never their own, another Admin's, or a Super Admin's.

Either way the target account is emailed the new password and must set their own replacement for it on next sign-in.
