

PIIPS

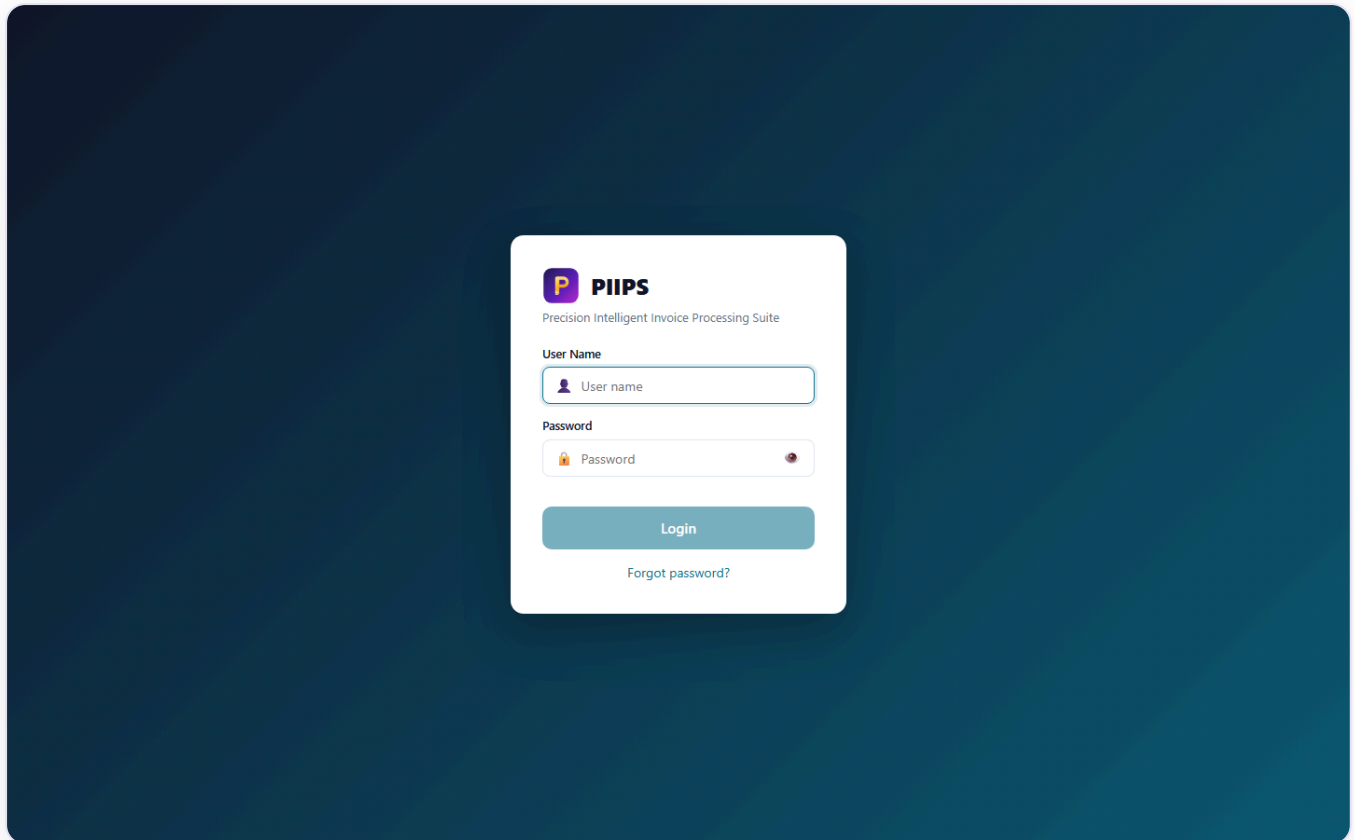

Precision Intelligent Invoice Processing Suite · v2.2

Role: Admin

A screen-by-screen guide to the invoice processing application,
covering exactly the screens available to your role.

Logging in

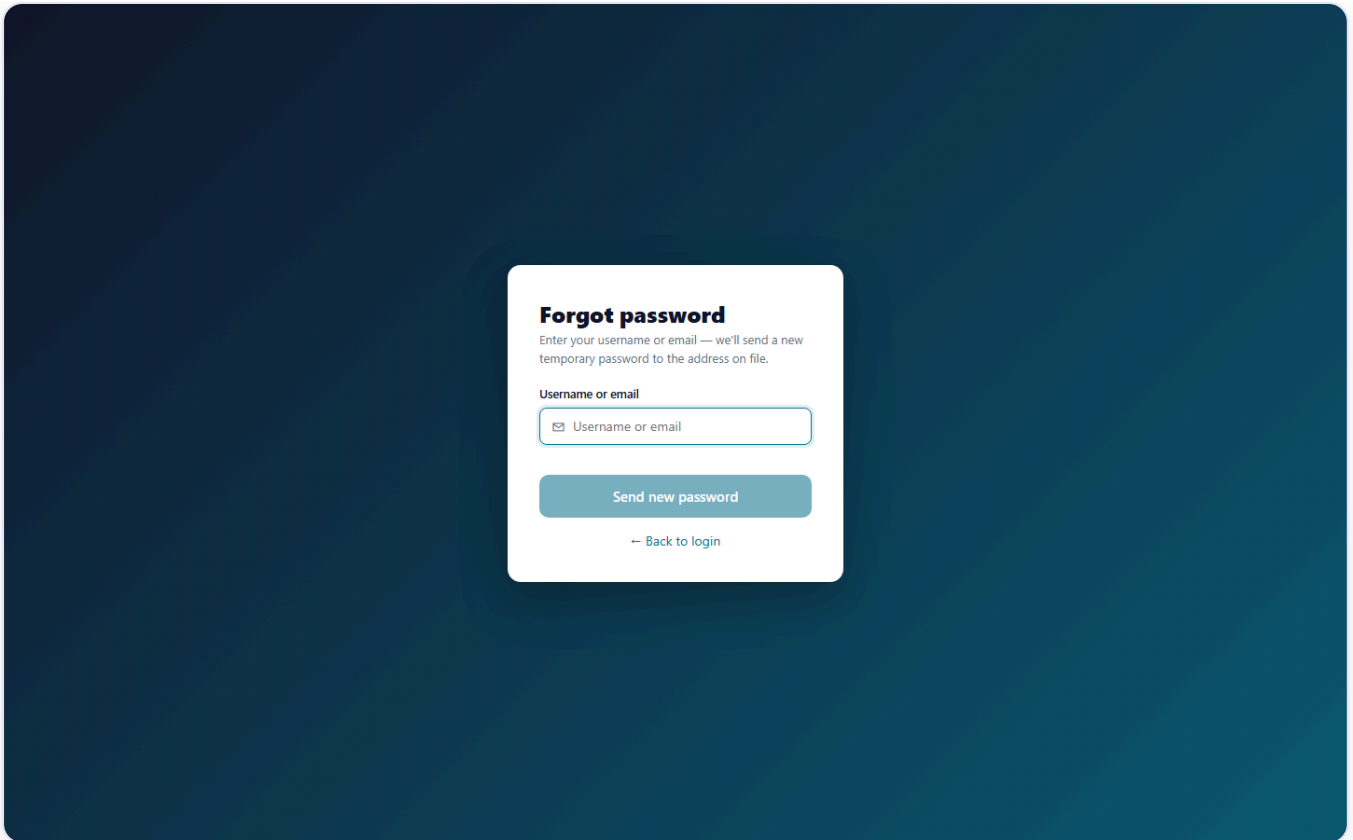

Open PIIPS in a browser and sign in with your username and password.

Type your username and password, then select **Login**. The password field has a show/hide (👁) button so you can check what you typed, and pasting into it is deliberately blocked — type it by hand so a copied value from the wrong place can't end up there unnoticed.

Forgotten your password? Select **Forgot password?** on the login screen (below). Nobody sets your password for you, including administrators — every password on PIIPS is system-generated and emailed to your official email address, and you're always required to choose your own on first use.

Already open elsewhere? PIIPS only keeps one copy of itself running at a time. Opening it in a second tab or window now shows a blocking **"PIIPS is already open"** screen there instead of the app — close or switch to the other tab, then select **Try Again** here.

Enter your username or email and submit. If an account matches, a new temporary password is emailed to it; the response is the same either way so the screen can't be used to check whether a username exists.

What each role can see

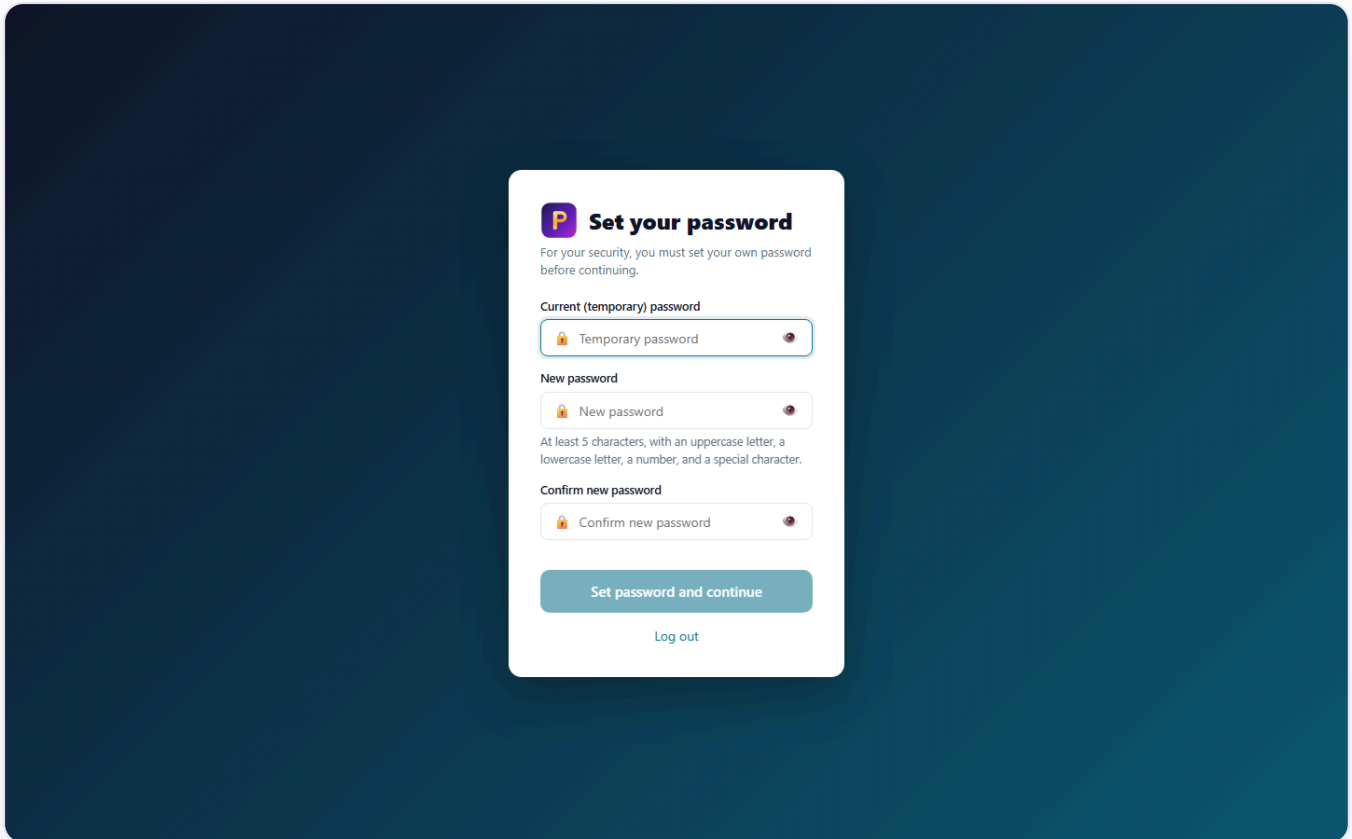

Once signed in, only the screens your role has access to appear in the left-hand sidebar — you will never see menu items outside your role's access, and the server enforces the same limits even if a screen were reached directly.

Setting your password the first time

The temporary password from your welcome email (or from a password reset) only gets you as far as this screen — you must choose your own password before doing anything else in PIIPS.

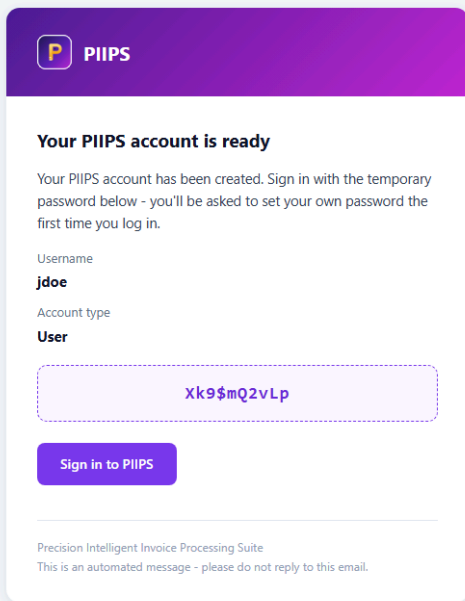

Enter the temporary password, then a new password meeting the policy shown on screen: **at least 5 characters, with an uppercase letter, a lowercase letter, a number, and a special character**. Select **Set password and continue** to enter the application.

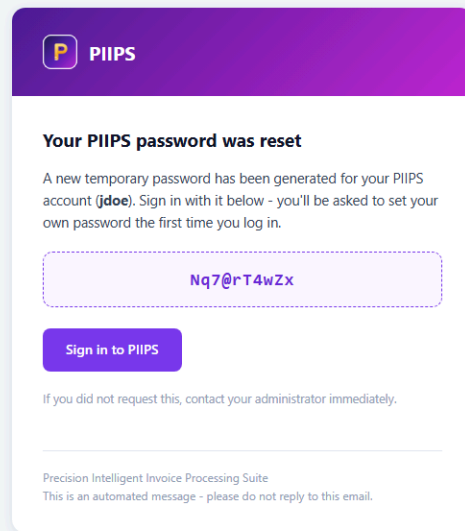

This same screen appears any time an administrator resets your password for you — a new temporary password is always emailed, and you always set your own replacement for it on your next sign-in.

What the emails look like

PIIPS emails you at three points: when your account is created, whenever your password is reset (by you via Forgot password, or by an administrator), and if your account's access is turned on or off.

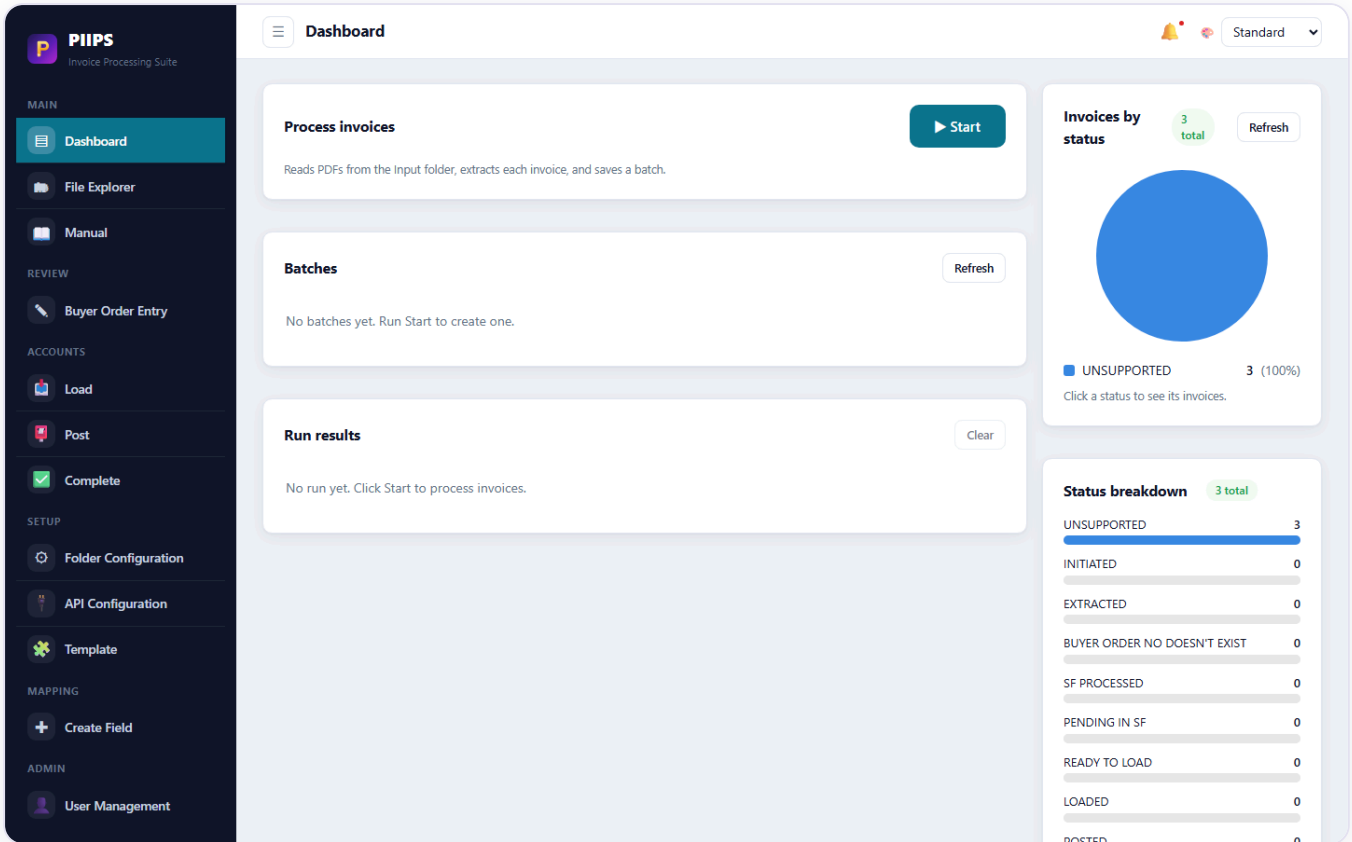

Welcome email

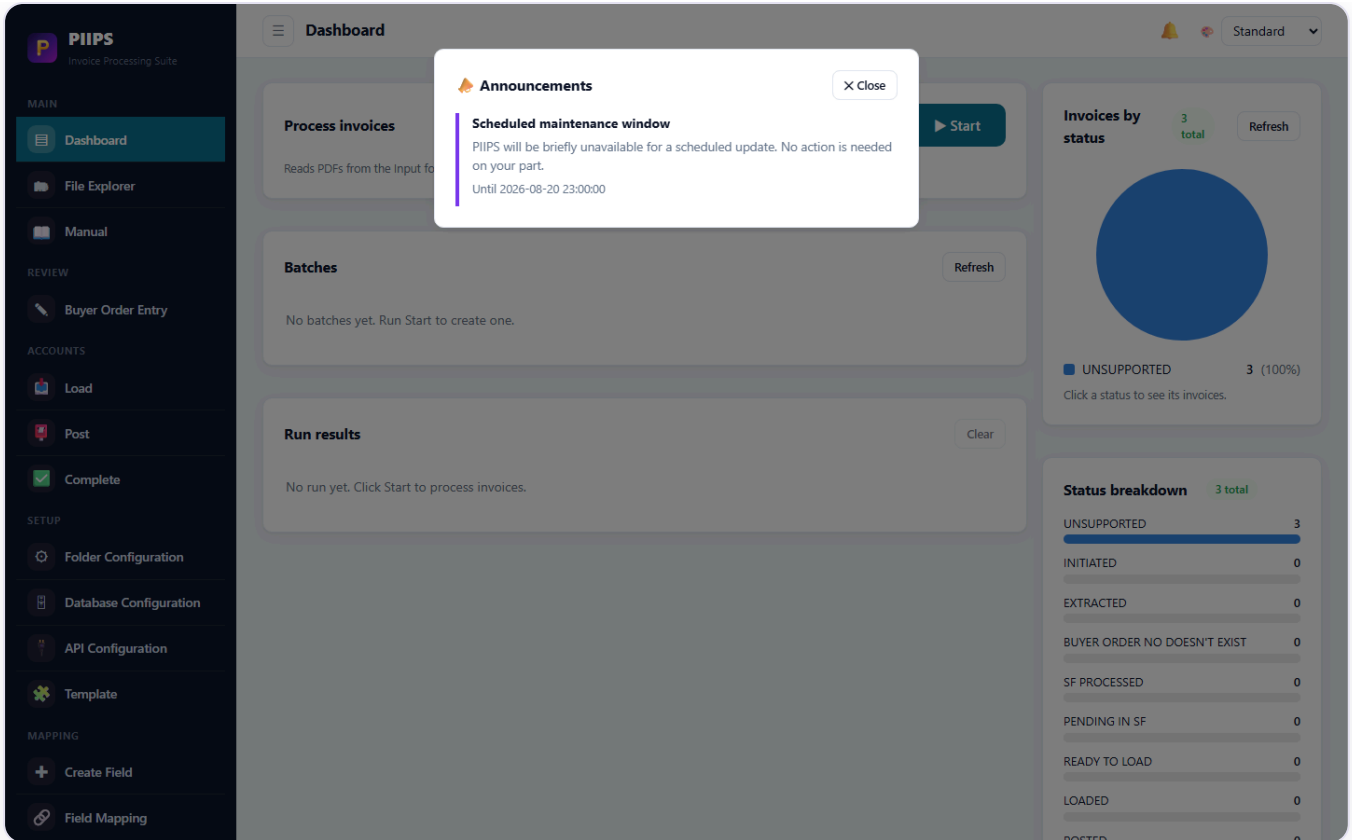

Password reset email

Dashboard

Your home screen after signing in.

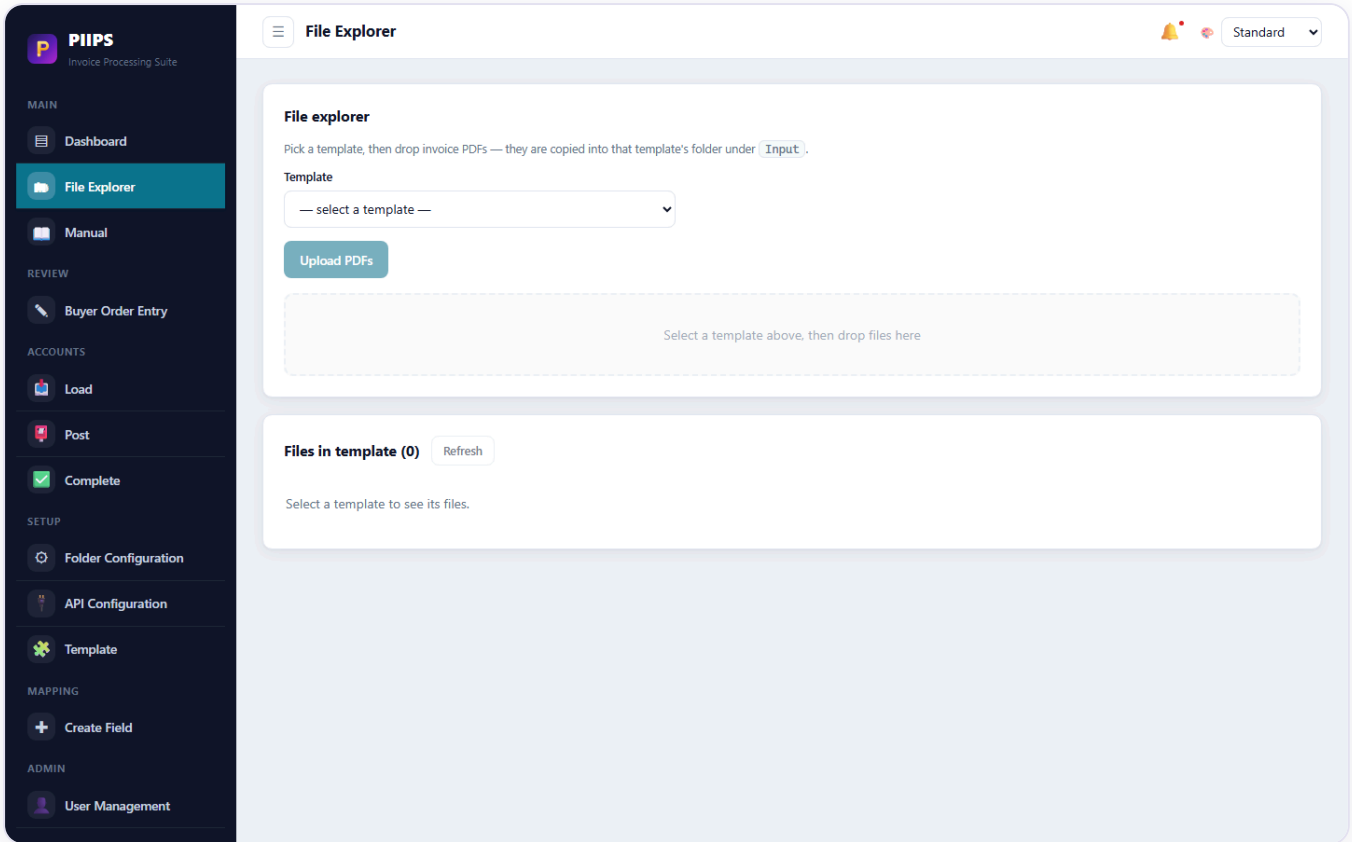

The right-hand panels show a live count of every invoice PDF the system knows about — a total badge next to **Invoices by status** and **Status breakdown**, a status pie chart, and a per-status count list you can click to jump straight to that status's invoices. The bell icon (🔔) in the top bar opens any active site-wide announcement a Super Admin has published — a red dot means there's one you haven't opened yet.

Opening an announcement from the bell icon

File Explorer

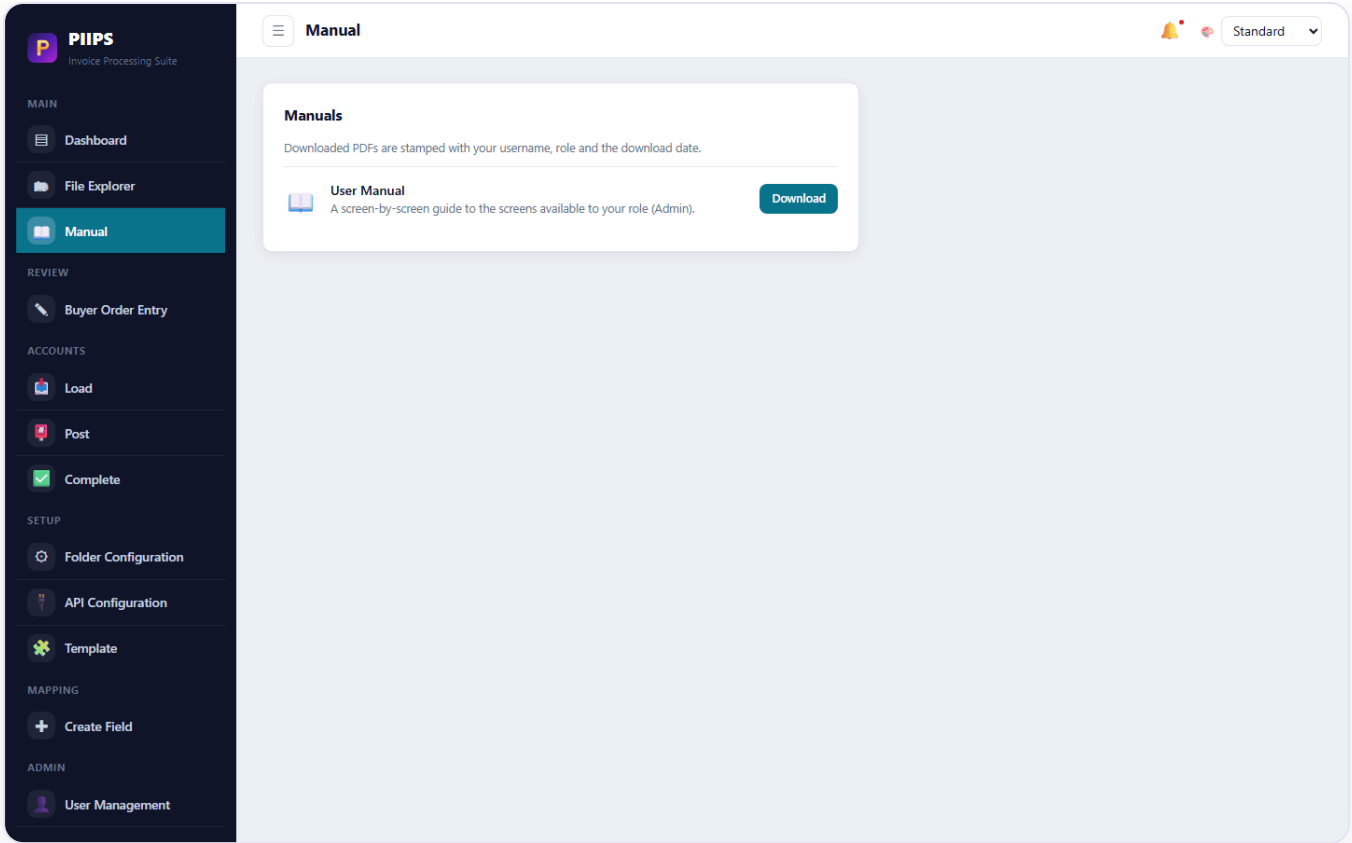

Everything PIIPS currently knows about, by folder.

File Explorer lists the PDFs sitting in the working folders: newly-dropped invoices waiting to be processed, anything the system couldn't confidently match to a known vendor format (**Unsupported**), and anything it recognised but couldn't fully read (**Incomplete Data**) — including scanned or photocopied PDFs, which are routed here rather than guessed at. Open a file directly from the list to preview it.

Manual

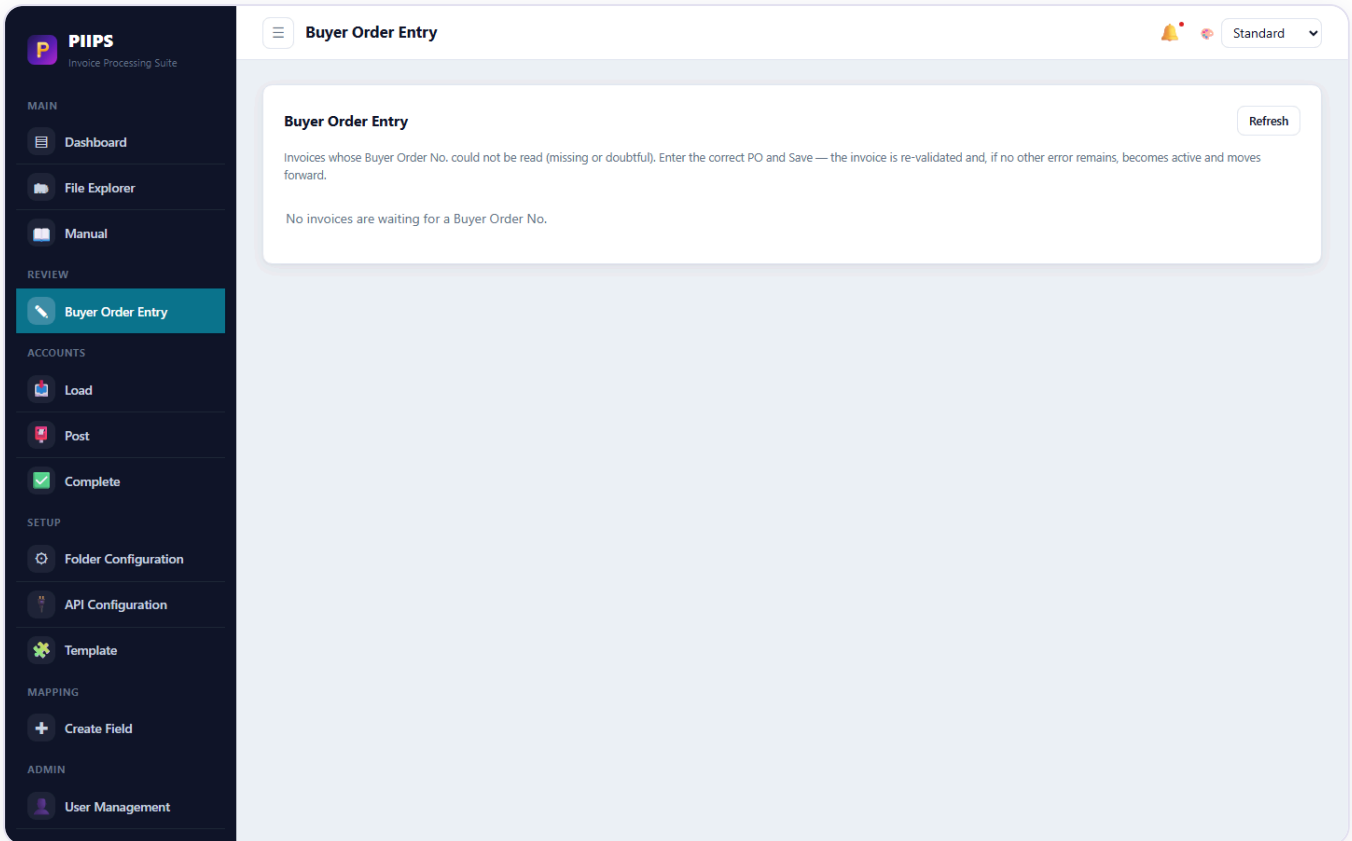

This document, from inside the application.

Every signed-in user can download their own manual at any time — always the edition matching your role, and stamped with your username and the date/time you downloaded it. Super Admins additionally see the full Developer Manual and the UAT/Live Deployment Guide here.

Buyer Order Entry

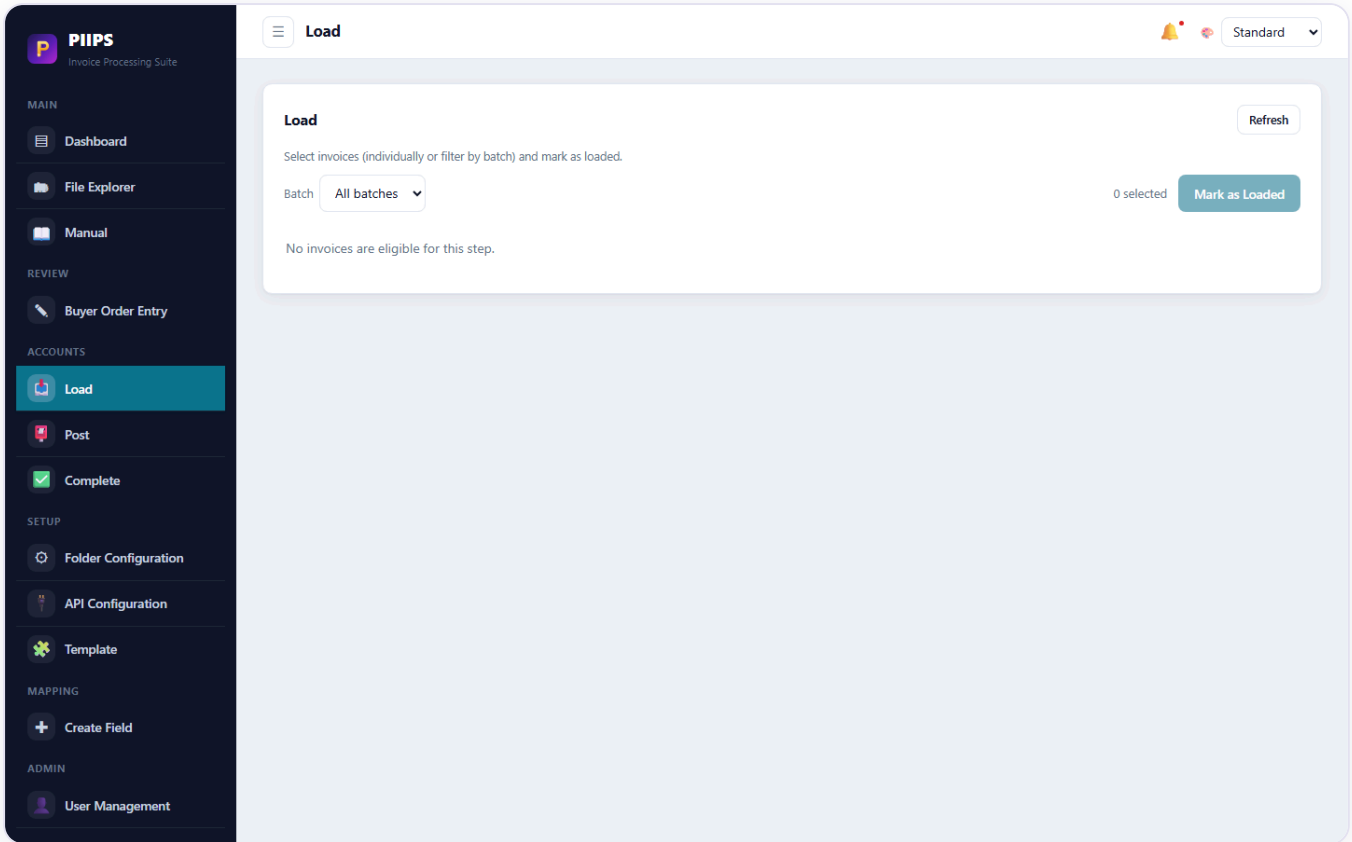

Confirm or correct a purchase order number PIIPS matched (or couldn't match) against SPRPUR before an invoice can be Loaded.

PIIPS tries to detect the buyer's PO number on every invoice automatically, splitting matches into **confident** and **doubtful**. Use this screen to review doubtful matches, or to enter a PO number by hand when none was detected. Nothing reaches the Load step without a confirmed PO number.

Load

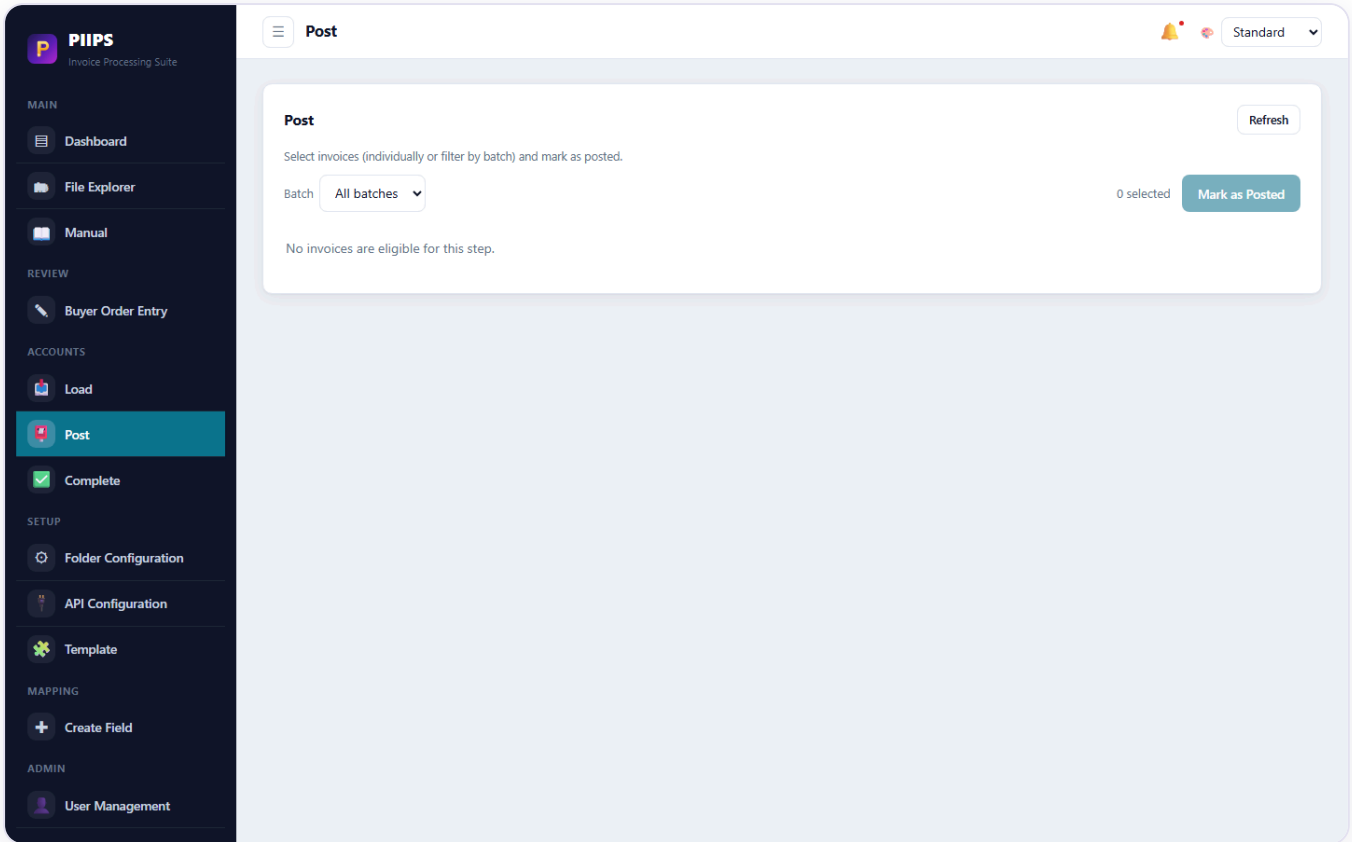

Bring a processed, PO-confirmed invoice into the system as a purchase record.

Loading is the first lifecycle step after extraction: it turns the extracted header/line/reservation data into a real Purchase record and moves the invoice's status to **LOADED**, ready for Accounts to Post.

Post

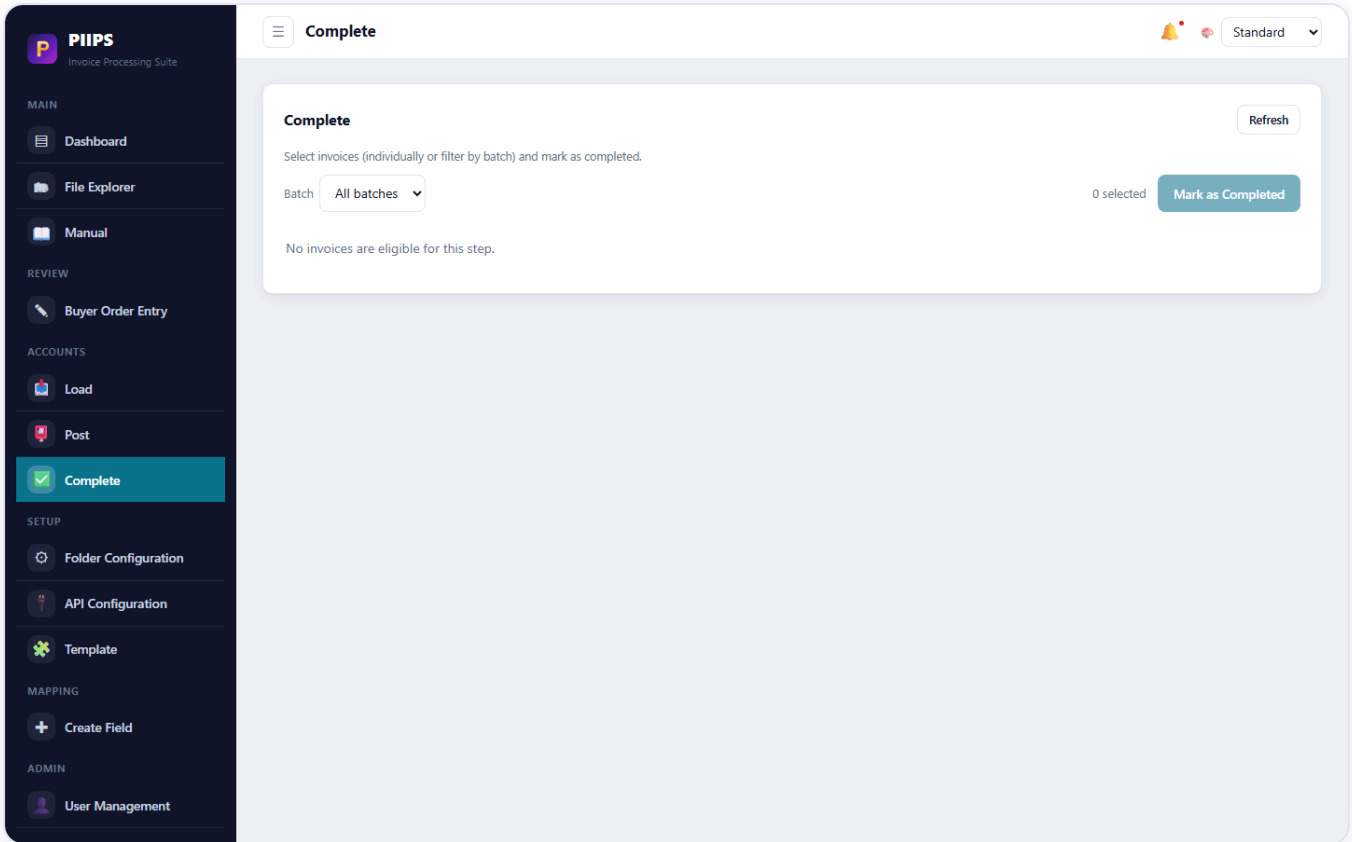

Send a Loaded invoice on to the downstream Service First system.

Posting calls the Service First API to record the purchase there and moves the status to **POSTED** once it succeeds, tracking whether the part was received (`IsSynced`).

Complete

Close out a Posted invoice once it's fully reconciled.

Complete is the final lifecycle step, marking an invoice finished once everything downstream has been confirmed.

Folder Configuration

Set the single working Folder Path PIIPS uses for Input, New_Format and its extracted output.

Folder Configuration

Standard

Folder

Folder Path

The working folder. Must be a folder on the **server machine** — not a network share or a mapped network drive. On save, the **Input** folder (with a subfolder for each template) and **New_Format** are created here, and extracted output is written here.

D:\PIIPS

Save

Every other folder (per-template Input subfolders, Unsupported, Incomplete Data, the ALL_INVOICES archive of every Posted/Completed invoice) lives underneath this one path.

API Configuration

Set the base URL of the Service First / NAV backend used for reservation and HSN lookups and for Posting.

User Management

Create accounts, control access, and manage passwords for other users.

The screenshot displays the PIIPS User Management interface. On the left is a dark sidebar with a navigation menu. The main content area is titled 'User Management' and contains two primary forms: 'Change Password' and 'Add user'.

Change Password Form:

- Header:** Change Password
- Description:** Assign a new password for another user — you can select any User/Accounts account (not yourself, another Admin, or a Super Admin). The new password is emailed to them and they must set their own on next login.
- User:** A dropdown menu labeled 'Select a user...'.
- New password:** A text input field with a strength indicator icon.
- Confirm new password:** A text input field with a strength indicator icon.
- Action:** A blue button labeled 'Change password'.

Add user Form:

- Header:** Add user
- Description:** A temporary password is generated automatically and emailed to the address below — the admin never sets a password directly. The user is required to set their own password the first time they log in.
- User Name:** A text input field with a user icon.
- Email:** A text input field with an email icon, containing the placeholder 'name@precisionit.co.in'.
- User Type:** A dropdown menu with 'User' selected.

Sidebar Menu:

- MAIN:** Dashboard, File Explorer, Manual
- REVIEW:** Buyer Order Entry
- ACCOUNTS:** Load, Post, Complete
- SETUP:** Folder Configuration, API Configuration, Template
- MAPPING:** Create Field
- ADMIN:** User Management (highlighted)

Adding a user

Give the new account a username and their official email address, and choose their role. There is no password field — PIIPS generates a policy-compliant temporary password and emails it to them automatically; the person creating the account never sees or sets it.

Activating / deactivating a user

Every row has an **Inactivate** / **Give access** button; either action emails the affected user a notice. You can't deactivate your own account, and the default **Sadmin** super admin account can never be deactivated by anyone — it's the one account guaranteed to always be available.

Change Password

Who can reset whose password is deliberately restricted:

- **Super Admin** — can assign a new password to *any* user, including themselves.
- **Admin** — can assign a new password only for a plain **User** or **Accounts** account — never their own, another Admin's, or a Super Admin's.

Either way the target account is emailed the new password and must set their own replacement for it on next sign-in.

What's New in v2.3

Role: Admin

The sections below cover every screen added or changed in this release, scoped to what your role can see.

Templates: Active / Inactive replaces one-way Delete

The Template list now shows a **Status** column (Active/Inactive) with an Activate/Deactivate button, instead of a permanent Delete. Deactivating a template is reversible - it can be turned back on with Activate at any time.

Deactivating is blocked until every batch that template has ever produced - including a file that's simply sitting in its Input folder but hasn't been run through Start yet - has actually reached Completed. The screen lists exactly which ones are still outstanding.

Renaming a template is blocked once it has any batch behind it at all, to avoid breaking that batch's data.

Creating a template whose name collides with an existing one - active or inactive - is blocked with a clear message telling you to activate the existing one instead.

The screenshot shows the PIIPS (Invoice Processing Suite v2.3) interface. On the left is a dark sidebar with a menu categorized into MAIN, REVIEW & UPDATE, ACCOUNTS, and SETUP. The 'Template' option is highlighted at the bottom. The main content area is titled 'Template' and features a '+ New Template' button and a 'Templates' tab. Below these is a search bar and a table with the following data:

TEMPLATE	ENTITY	INVOICE TYPE	PO NUMBER FORMAT	STATIC VALUES	STATUS	
PT\PART\Services_Chennai	PT	PART	PIIPSP0-2627-	32	Active	<button>Deactivate</button> <button>History</button>
PT\SERVICE\Services_Chennai	PT	SERVICE	PO-2627-	33	Active	<button>Deactivate</button> <button>History</button>
PT\PART\Bangalore	PT	PART	PIIPSP0-2627-	26	Active	<button>Deactivate</button> <button>History</button>

At the bottom of the table, it indicates '3 rows' and includes pagination controls: 'Prev', 'Page 1 / 1', and 'Next'.

New menu: Completed Invoices

A new menu lists every invoice that has finished the full Load → Post → Complete lifecycle - the same ones archived into the ALL_INVOICES folder along the way.

The File Name column shows that archive copy's own name ("**<Invoice No.>_<Vendor Name>.pdf**") so it matches exactly what you'd find in that folder. Clicking it still opens the original PDF.

Checkbox selection plus a **Download Selected** button downloads the chosen PDFs one after another.

Dashboard: Duplicate column

The Batches table's per-status columns now include **Duplicate**, shown right after New Template - it was a real, trackable status before, it just wasn't shown as its own column.
